🔍 Key Insights & Forecast

Clone rate is extraordinary. 46.8% clone/view ratio signals very high developer intent — visitors are not browsing, they're installing.

v1.0.0 stable release was the inflection point. Sep 25 generated 77 views + 59 clones in a single day — 7× the daily average.

Stars are dormant between spikes. 21 stars in May, then near-zero until Aug 25. Content or release announcements are the primary driver.

HN post (Sep 30) is the active catalyst. 44 views on day 1 with low clones — HN traffic is top-of-funnel. Watch clones Oct 2–4 for conversion signal.

7-day forecast (Oct 2–8): Views ~20–35/day if HN fades; spike to 60–80 possible if it gains front-page traction. Clones likely 5–12/day baseline.

Star forecast: At current velocity (0.4/day

post Sep 26), expect 36–38 stars by Oct 8. A top-10 HN position could add 15–40 stars in 24h.

Code activity is bursty. Large spikes (Jul 11: +2794, Sep 19: +2089) confirm feature-heavy sprints followed by quiet periods — classic solo dev pattern.

Forecast is based on linear trend from last 7 traffic days + historical event correlation. Not a statistical model.
